

Project Idea Form

Fill one form for each of your 3 project ideas

Your Name	Mitaali Singh	College / Year	VIT, Bhopal (2027)
Idea Number	Idea 2 (part- B)	Date	17. 05. 2026

How to use this form

- Fill one separate form for each of your 3 project ideas.
- Write in simple language. Short and clear is better than long.
- Read the hint and example below each question before answering.
- If you don't know an answer, write what you think honestly. It is okay to say "I need help with this part."

1. Project Name

Give your project a short, simple name.

Example: StudyBuddy, QuickKart, FormFiller, ResumeFix **Your**

answer:

clover

2. What is your project in one sentence?

Explain it like you are telling a friend. Don't use technical words.

Example: An app that helps Class 10 students revise NCERT chapters by turning them into short quizzes.

Your answer:

It helps with remote team work across different tools, when multiple people work on multiple platforms for a project. This project quietly connects workspaces, reads chaotic daily updates and builds a live, visual, interconnected "brain" of the company's knowledge.

eg: When a remote developer logs on at 11 PM and asks, "Where is the updated payment gateway API endpoint and who worked on it last?", the app doesn't just search for keywords. It maps the relations and says: "Alakh updated it 3 hours ago in the backend repository; here is the direct link to the code line and the summary of why he changed it."

3. What problem does it solve?

Describe the problem people face today. Who has this problem? How often? Why is it annoying or difficult?

Example: Students forget what they read in textbooks. They have to re-read full chapters before exams, which takes a lot of time and is boring. **Your answer:**

Because remote team members work at different times, nobody ever knows the true status of a project. Coworkers are forced to constantly interrupt each other with texts like, "Hey, did you finish that API?" or "Who changed this file last night?" just to get basic context. This forces managers to play detective, manually digging through chaotic GitHub commits and chasing people down just to piece together what actually got done. This lack of visibility delays progress, causes communication lag, and leads to massive project management friction.

4. Who will use this? (Your users)

Be specific. "Students" is too broad. Mention age, class, city, or job if possible.

Example: Class 9 and 10 students from CBSE schools in Indian cities, who use a phone or tablet at home for studying. **Your answer:**

Remote-first software development teams, project managers, and startup founders who collaborate across different time zones and messaging platforms.

5. How are people solving this problem today?

What do they do RIGHT NOW without your project? Name any apps, websites, or manual methods.

Example: They re-read the textbook, watch YouTube videos, or use apps like BYJU'S and Vedantu.

Your answer:

1. People manually scroll through clogged Slack channels,
2. search through cluttered WhatsApp histories,
3. or hold repetitive, exhausting daily live sync meetings just to ask coworkers for progress updates.

6. What will your project do differently or better?

Why would someone choose your project instead of what they use today?

Example: Other apps have long video lessons. Ours gives 5-minute quizzes after every chapter, so students can revise quickly between classes. **Your answer:**

Instead of a simple text chatbot that relies on manual searching, Clover AI works completely in the background to analyse text logs, code updates, and tasks across platforms. It visually connects how files, tasks, and people are linked, automatically answering complex questions

like "Who changed this file last night and why?" while keeping 100% of the data private and secure.

7. Main features (top 3 to 5)

List the most important things your project will do. Keep them short, one line each.

Example: 1) Upload chapter PDF — 2) Auto-generate quiz — 3) Track score — 4) Daily revision reminder

Your answer:

1. Cross-Platform Ingestion: Webhooks that silently and securely track daily text updates and code commits across your team's chat channels and repositories.
2. Instant "One-Prompt" Status Retrieval: A global conversational bar allowing managers to type a simple prompt—like "What did Alakh work on last night?"—and instantly get a neat, bulleted timeline of their progress.
3. Direct Source Mapping: The AI doesn't just give text answers; it generates a concise summary of *why* a change was made and provides a direct link to the exact line of code in the repository.
4. Interactive Knowledge Graph: A beautiful visual canvas showing node-based connections between team members, active tasks, and recent code updates.
5. Smart Summary Generator: Automatically creates a concise, bulleted timeline of progress for managers and developers at the end of each work cycle.

10. What technology will you use?

List the languages, frameworks, databases, or AI tools you plan to use. Mention if you are unsure.

Example: Frontend: React. Backend: FastAPI (Python). Database: PostgreSQL. AI: Google Gemini API for generating quiz questions. **Your answer:**

Needs further discussion but for AI it will use python with RAG framework, langchain and LLM integration.
