

Project Idea Form

Fill one form for each of your 3 project ideas

Your Name	Naman Gupta	College / Year	VIT, Bhopal (2027)
Idea Number	Idea 2 (part- A)	Date	17.05.2026

How to use this form

- Fill one separate form for each of your 3 project ideas.
- Write in simple language. Short and clear is better than long.
- Read the hint and example below each question before answering.
- If you don't know an answer, write what you think honestly. It is okay to say "I need help with this part."

1. Project Name

Give your project a short, simple name.

Example: StudyBuddy, QuickKart, FormFiller, ResumeFix **Your**

answer:

Orchestra

2. What is your project in one sentence?

Explain it like you are telling a friend. Don't use technical words.

Example: An app that helps Class 10 students revise NCERT chapters by turning them into short quizzes.

Your answer:

It's basically an AI project manager that looks at a big app idea, breaks it down into a game plan for the team, and automatically tracks who is working on what part of the project or platform.

3. What problem does it solve?

Describe the problem people face today. Who has this problem? How often? Why is it annoying or difficult?

Example: Students forget what they read in textbooks. They have to re-read full chapters before exams, which takes a lot of time and is boring. **Your answer:**

When a team builds an app, they split their work across different platforms—GitHub for code, Figma for design, and Discord for chat. This creates major headaches like: The "Where Do We Start?" Dilemma: Breaking a massive app idea down into structured, step-by-step technical tasks is exhausting and takes hours of debating.

1. The Invisible Progress Ghost: After that tracking the progress of the divided work for each person.

4. Who will use this? (Your users)

Be specific. "Students" is too broad. Mention age, class, city, or job if possible.

Example: Class 9 and 10 students from CBSE schools in Indian cities, who use a phone or tablet at home for studying. **Your answer:**

A new project manager for small teams, student hackathon participants and

5. How are people solving this problem today?

What do they do RIGHT NOW without your project? Name any apps, websites, or manual methods.

Example: They re-read the textbook, watch YouTube videos, or use apps like BYJU'S and Vedantu.

Your answer:

1. Manual Tracking Boards: Teams use apps like Jira, Trello, or Linear, but they require developers to manually drag cards between columns.
2. Chasing via Chats: Managers manually assign them roles and task based on the knowledge on the projects.
3. Manual Brainstorming: Teams spend the first few days of a project on Zoom calls or Google Docs trying to manually guess how to split up the software architecture into tasks.

6. What will your project do differently or better?

Why would someone choose your project instead of what they use today?

Example: Other apps have long video lessons. Ours gives 5-minute quizzes after every chapter, so students can revise quickly between classes. **Your answer:**

Our project focuses on intelligent SDLC orchestration. Instead of just logging tasks, the AI acts as a technical architect that maps out the exact engineering dependencies of your specific stack (ensuring backend, frontend, and database tasks are sequenced correctly). It analyzes individual team member strengths based on their past activity to recommend the most optimal workload distribution, ensuring no single developer is bottlenecked and the development cycle flows seamlessly from architecture to deployment without alignment meetings.

7. Main features (top 3 to 5)

List the most important things your project will do. Keep them short, one line each.

Example: 1) Upload chapter PDF — 2) Auto-generate quiz — 3) Track score — 4) Daily revision reminder

Your answer:

1. AI Blueprint Generator: Paste a raw app idea, and the AI automatically generates a complete step-by-step technical task roadmap.
2. Multi-Platform Webhook Listeners: Automatically captures live updates from GitHub commits and Figma design changes in real time.
3. Auto-Updating Progress Board: A visual dashboard that automatically moves tasks from "In Progress" to "Done" based on actual code merges, requiring zero manual updates.

10. What technology will you use?

List the languages, frameworks, databases, or AI tools you plan to use. Mention if you are unsure.

Example: Frontend: React. Backend: FastAPI (Python). Database: PostgreSQL. AI: Google Gemini API for generating quiz questions. **Your answer:**

Not discussed yet but will be using local LLM's or use API's from openAI, gemini or claude for AI orchestration.
